Introduction

This guide outlines minimum hardware & software requirements and discusses important topics to consider when planning your website install. Requirements will vary based on utilization and monitoring the performance of your server is always recommended. Every the use case is different and the infrastructure should be able to expand as site usage changes.

Hardware Requirement

The requirements below refer to the minimum available hardware required to run Airfinch. These recommendations are designed for Small and Medium sized websites. For guidance on large and extra large sites you will need to estimate the server scalability based on the peak visitors, average response time of the page and the users click frequency. All page content is stored in the database, while attachments and media files are stored in the file system. The more media files you have, then more disk space you will require.

The following is a guideline for the required hardware:

AppKodes Development Team

Hitasoft Technology Solutions Private Limited

Digital Marketplace: <https://appkodes.com>

Corporate website: www.hitasoft.com

	Minimum	Recommended
RAM	2 GB	4 GB
CPU	1vCPU	2vCPU
Hard Disk	50 GB SSD	80 GB SSD
Transfer	2 TB	4 TB

Software Requirement

Before you install and run Airfinch on your server, the following software should be able to install.

Language / Development	Tool Names
Operating System	Ubuntu (Or) Any Linux Distribution
Applications	Apache2.X, NodeJS 14.X, PM2 NodeJS
Database	MySQL 8.X
Libraries	ModeRewrite (rewrite should be enabled), CURL, GD
Packages	phpMyAdmin 5.X
PHP Extensions	IonCube loader (Version 12 or above), PHP 8.0

Recommended Hosting Provider

We recommend the following two hosting,

- DigitalOcean (Signup link: <https://m.do.co/c/2e0c2f84d5dc>)
- Amazon AWS (Signup link: <https://goo.gl/2vceXS>)

AppKodes Development Team

Hitasoft Technology Solutions Private Limited

Digital Marketplace: <https://appkodes.com>

Corporate website: www.hitasoft.com

Both servers are expandable on run time.

Capacity

The below formula we use for our estimates, that captures the essence and provides us an approximate number of how many users you can have simultaneously on your site.

*$(\text{number of CPU cores} / \text{Average Page Response Time in seconds}) * 60 * \text{User Click Frequency in seconds} = \text{Maximum simultaneous users}$*

- 1 core and 2GB RAM support up to 300 concurrent users.
- 2 cores and 4GB RAM support up to 600 concurrent users.
- 4 cores and 8GB RAM support up to 1,200 concurrent users.
- 8 cores and 16GB RAM support up to 2,400 concurrent users.

Details required for Professional Installation

Professional installation needs the following details with all the above hardware and softwares requirements should be met.

1). If you use the server Digital Ocean or AWS, We need the following details.

i) Root access username and password

(OR)

Keyfile, Username(root access)

ii) SSH / SFTP / FTP access to the file system.

ii) PHPMyadmin username and password.

2). If you use other servers, We need full access like Cpanel or WHM panel access
